Organisms recovered alongside siphonophore genomes

A Siphonophore hosts

Photograph placeholder

Physalia

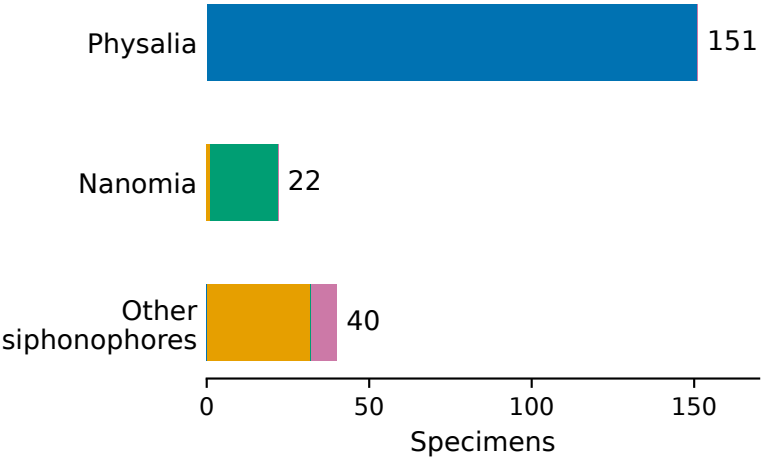
Sea surface

Photograph placeholder

Nanomia septata

Water column

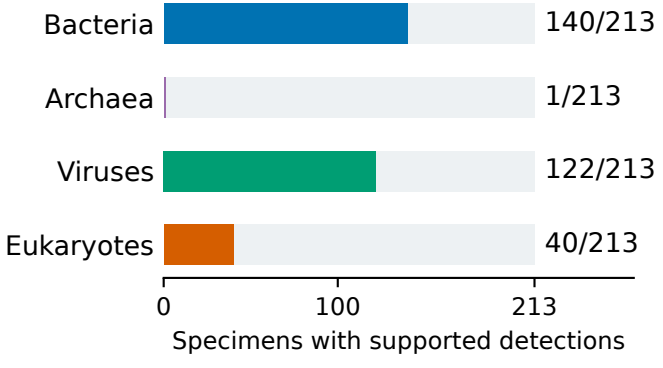
B 213 specimens in 4 studies



C Host sequencing provides a second biological record

Collected siphonophore tissue → Short-read host-genome libraries → Identify and validate non-host sequences → Interpret organisms using natural history

D Recovered across the cohort



E Biological questions

Microbial associates

Which bacteria, archaea and viruses accompany siphonophores?

Prey and parasites

Which eukaryotes suggest feeding or parasite associations?

Host and collection context

How do detections differ among hosts and sampling locations?
